

Worthwhile Knowledge about the NovaMaster

The Mannheim Team is now introducing their latest development, after the SWF's Krantechnik GmbH has successfully established the NOVA wire rope-generation (with the big drum) into the market.

The NovaMaster is an especially developed device for the NOVA hoist, which controls and protects hoist and crane, in this way enabling the modern crane equipment to become much more economical.

The NovaMaster is an electronic control device, which works without mechanical wearing parts.

We would like to stress the NovaMaster does not need any additional equipment or computer to analyse the data.

NovaMaster offers three different equipment packages, whereas all of the packages include an overload device, a control of power supply (phase-sequence), a motor temperature control and a break wear control.

NovaMaster SWP (Safe Working Period)

This concerns a condition-monitoring unit.

Information's like the number of starts, the number of overloads, safe working period, total of operation time and number of lifting cycles.

NovaMaster Load Display

This device is a practical load display in the pendant.

The load can be obtained by an interactive display. This option can be combined with NovaMaster SWP.

NovaMaster Tandem

It was developed for the simultaneously usage of several hoists. The hoists are "communicating" with each other, this gives the opportunity of summarizing the different loads. This package includes NovaMaster SWP.

A crane equipped with the NovaMaster enables the user to be farsighted and favourable in the economic management. The time on the crane" can be thereby reduced to a minimum.

Because NovaMaster enables to have the most important functions under control right from the place of operating, this provides a never known user-friendliness. NovaMaster allows you to foresee when the next service will be necessary. Material flow can be perfectly planed as downtime can be forecast easier.
